

# Radiative Transfer Methods: New Exact Results (Code ARTY) and Testing the Accuracy of Some Numerical and Approximate Methods (e.g. ALI-like methods)

Loïc Chevallier

Postdoc: University of Kentucky, Dept. Physics & Astronomy

# Outline

- History
- Survey of methods
- 2 slides of formula (standard problem)
- Known difficulties
- ALI tests
- Exact results: ARTY
- Classical reference solutions and benchmarks
- Test 1: albedo = 0 (cosmology)
- ALI: what's wrong, how to improve ?
- conclusion

# History

- Transport theory (TT) : propagation of light (energy) in an absorbing, emitting and scattering medium
- founded par astrophysicists (early 20th) : Schuster (1905), Schwarzschild (1906,1914)
- First reviews: Milne (1930), Hopf (1934)
- TT interdisciplinarity : astrophysics, external geophysics, neutronics, chemistry, biology, etc.
- *bibles* 50-60s (astrophysics): Chandrasekhar (1950), Kourganoff (1952), Sobolev (1963, 1975), Busbridge (1960), Ivanov (1973), Van de Hulst (1980)
- Specific intensity  $I(\mathbf{r},t,\mathbf{n},\mathbf{v})$  : 7 variables (too much)

# Solving methods

(Wehrse & Kalkofen 2006, A&A Rev.; I. hubeny; R. Despres; J. Morel)

- **Exact** (known mathematical properties, no discretization):  
Hopf, Busbridge, Mullikin (Das),  
Ambartsumian, Sobolev (Danielan),  $\sqrt{\epsilon}$ -law (Sobolev 1958),  
Finite Laplace Transform + ARTY (Chevallier & Rutily, 2005),
- **Simulation**: Monte-Carlo
- **Numerical** (full exact equation, discretized variables): discrete  
ordinates,  $S_N$ , spherical harmonics  $P_N$ ,  $F_N$  method (C. Siewert),  
Feautrier, variable Eddington factor,  
**Ax=b**:  $\Lambda$ -iteration (ALI/GS/SOR: XIXe-1986), conjugate gradient  
(Krylov solver) + preconditioning, CEP (M. Elitzur)...
- **Approximate** (equation or solution) : 1-stream, 2-stream, Eddington,  
no scattering (albedo = 0), diffusion,  
moment methods (hydro M1...), escape probability ...
- **Type?** Statistical methods, unstructured grids, Fourier transform
- **LITTERATURE**: JQSRT, TTSP mainly.

# Transfer theory - The standard problem

$$\forall \nu, \mu \frac{\partial I}{\partial \tau}(\tau, \mu) = I(\tau, \mu) - S^*(\tau) - \frac{\varpi(\tau)}{2} \int_{-1}^1 I(\tau, \mu') d\mu$$

- plane-parallel,
  - continuum + line (add  $\phi$ )
  - diffusion:
- monochromatic, isotropic
- albedo  $\omega = 1 - \varepsilon$
  - $S^*$ : internal source (LTE:  $\varepsilon B$ )

$$I_n(\tau) = \frac{1}{2} \int_{-1}^1 I(\tau, \mu) \mu^n d\mu$$

$$J(\tau) = I_0(\tau)$$

$$F(\tau) = 4\pi I_1(\tau)$$

$$P(\tau) = \frac{4\pi}{c} I_2(\tau)$$

$$\tau = \int_z^{z^*} \chi(z') dz'$$

# Transfer theory - integral formulation

(difficulty apparent as compared to differential formulation, and BC)

$$I(\tau, \mu) = \begin{cases} I(0, \mu) \exp(\tau/\mu) - \frac{1}{\mu} \int_0^\tau S(\tau') \exp[(\tau - \tau')/\mu] d\tau' & \text{if } -1 \leq \mu < 0, \\ S(\tau) & \text{if } \mu = 0, \\ I(\tau^*, \mu) \exp(-(\tau^* - \tau)/\mu) + \frac{1}{\mu} \int_\tau^{\tau^*} S(\tau') \exp[-(\tau' - \tau)/\mu] d\tau' & \text{if } 0 < \mu \leq +1. \end{cases}$$

$$S(\tau) = [1 - \varpi(\tau)]S^*(\tau) + \varpi(\tau)J_0(\tau) + \frac{\varpi(\tau)}{2} \int_0^{\tau^*} E_1(|\tau - t|)S(t)dt$$

$$J_0(\tau) = \frac{1}{2} \int_{-1}^0 I^-(\mu) \exp(\tau/\mu) d\mu + \frac{1}{2} \int_0^1 I^+(\mu) \exp[-(\tau^* - \tau)/\mu] d\mu$$

- $S = (1-\omega) S_0 + \omega J$ : source function ( $J=\Lambda$ : mean intensity)
- $S_0 = (1-\omega) S^* + \omega J_0$ : primary source function (**known**)
- LTE:  $S^*(t) = B[T(t)]$  (Planck)
- **Difficulties due to scattering:  $\omega \rightarrow 1$  and/or  $\tau^* \rightarrow +\infty$**

# ALI method - principle

(I. Hubeny, *Stellar Atmospheres Theory: An introduction*, 2001)

In a seminal paper Cannon (1973) introduced into astrophysical radiative transfer theory the *method of deferred corrections* (also called, somewhat inaccurately, an *operator splitting*), long known in numerical analysis. The idea consists of writing

$$\Lambda = \Lambda^* + (\Lambda - \Lambda^*) , \quad (121)$$

where  $\Lambda^*$  is an appropriately chosen *approximate lambda operator*. The iteration scheme for solving (119) may then be written as

$$S^{(n+1)} = (1 - \epsilon)\Lambda^*[S^{(n+1)}] + (1 - \epsilon)(\Lambda - \Lambda^*)[S^{(n)}] + \epsilon B , \quad (122)$$

or, in a slightly different form whose importance becomes apparent later,

$$S^{(n+1)} - S^{(n)} = [1 - (1 - \epsilon)\Lambda^*]^{-1} [S^{\text{FS}} - S^{(n)}] , \quad (123)$$

where

$$S^{\text{FS}} = (1 - \epsilon)\Lambda[S^{(n)}] + \epsilon B . \quad (124)$$

# Known difficulties (**solutions**)

$$S(\tau) = S_0(\tau) + \varpi(\tau) \frac{1}{2} \int_0^{\tau^*} E_1(|t - \tau|) S(t) dt$$

- $E_1$  narrow: slow convergence (**preconditioning, acceleration**)
- $E_1$  weakly singular:  $dS/d\tau(0)$  infinite (**grid refinement**)
- (High) gradients in  $S_0$  (**gr, linear interpolation instead parabolic**)
- Optically thick spectral lines ( $\tau^* \gg 1$ ,  $1-\omega \ll 1$ ) (**gr**)
- Iterative methods stopping criterion (**multi-grid?**)
- Discretization, numerical parameters (**gr**), roundoff errors
- Iterative methods are slow, e.g. multi-D (**Krylov, parallel?**)

# Known difficulties - singular $E_1$ kernel

$$S(\tau) = S_0(\tau) + \varpi(\tau) \frac{1}{2} \int_0^{\tau^*} E_1(|t - \tau|) S(t) dt$$

$$E_1(\tau) = \int_0^1 \exp(-\tau/\mu) \frac{d\mu}{\mu}$$

- $E_1(\tau)$ : kernel,  $E_1(0) = \infty$   
→ singular integral equation
- non-local in  $\tau$ , but  $E_1$  tiny range,  
 $Ax=b$ ,  $A$  **almost** diagonal  
→ slow convergence
- Escape probability for lines is **bad**:
  - x2: Hubeny 2001,
  - 50%: Elitzur & Asensio Ramos 2005)

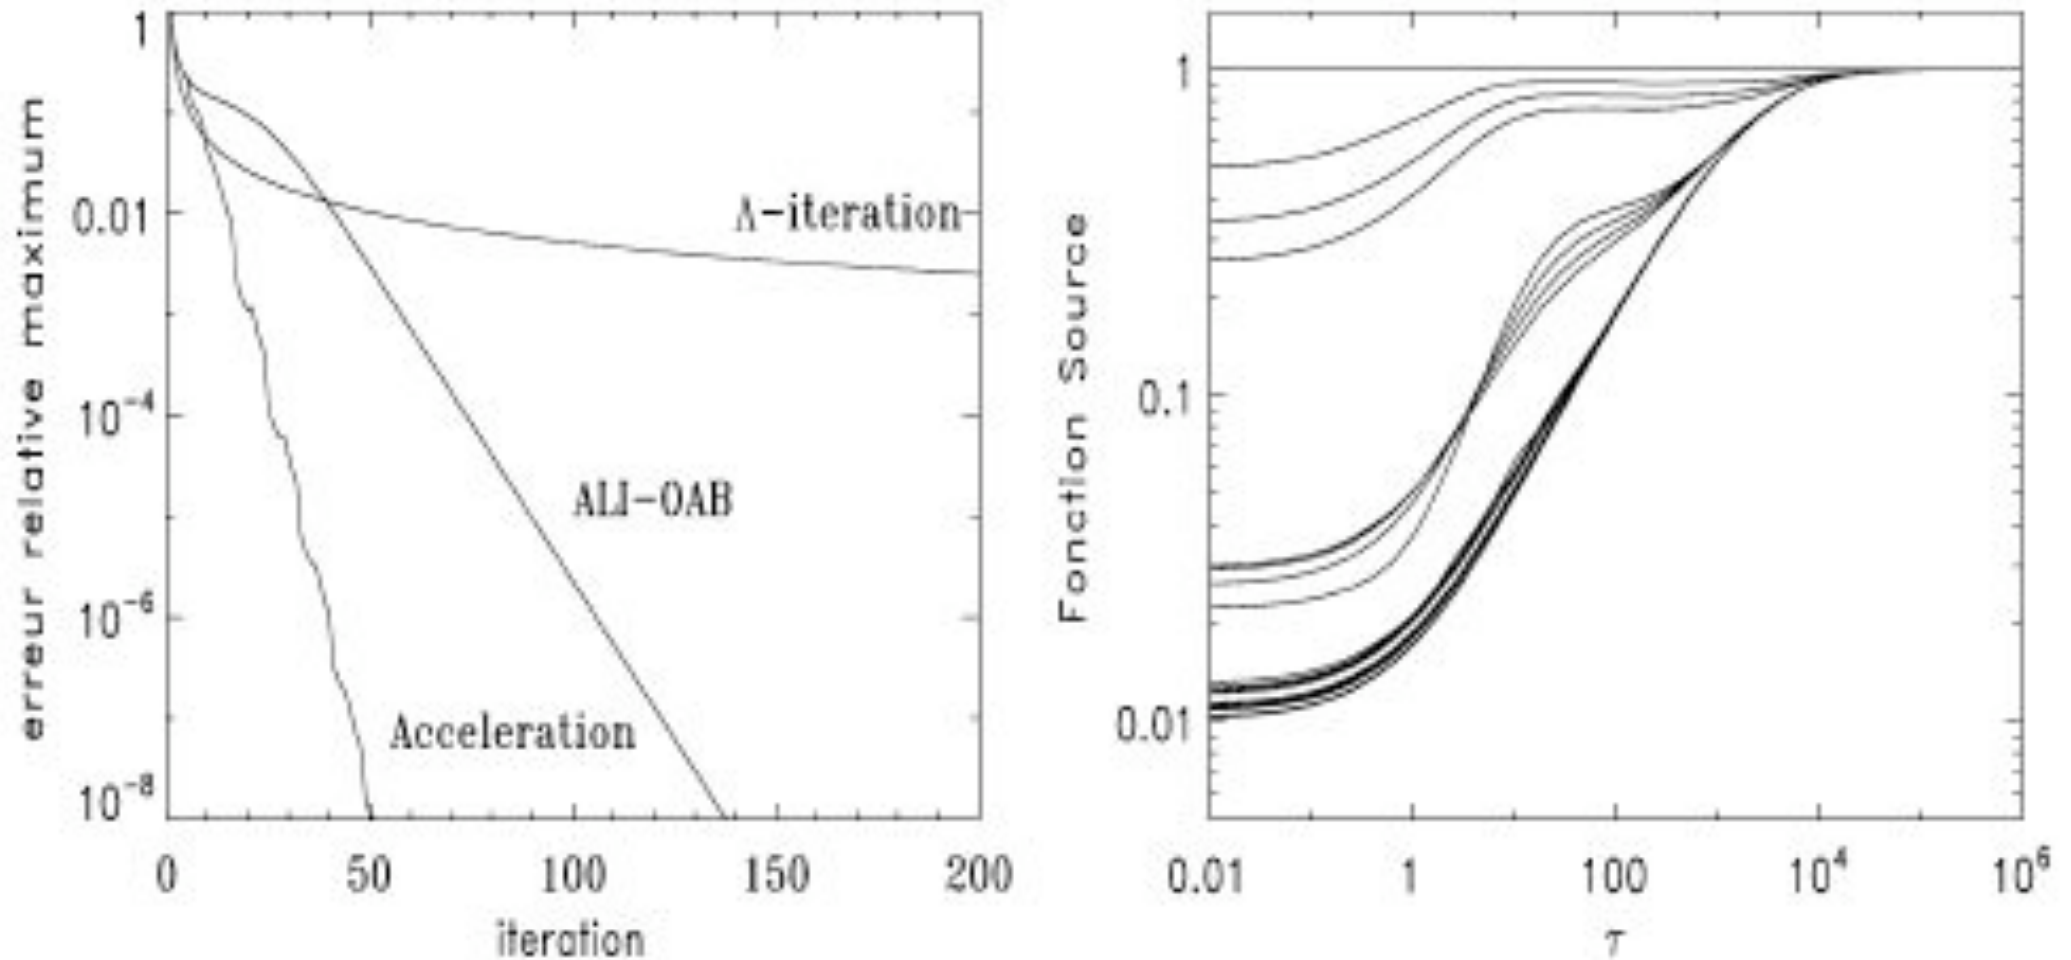

# Known difficulties - slow convergence

Source function  $S(\tau)$  with iterations for  $\Lambda$ -iteration (left) and ALI (right)

Paletou, C. R. Acad. Sci. Paris, t. 2, Serie IV (2001)

# Known difficulties - slow convergence

Accuracy with iteration (left) and  $S(\tau)$  with iterations for ALI+Ng (right)

Paletou, C. R. Acad. Sci. Paris, t. 2, Serie IV (2001)

# Known difficulties (**solutions**)

$$S(\tau) = S_0(\tau) + \varpi(\tau) \frac{1}{2} \int_0^{\tau^*} E_1(|t - \tau|) S(t) dt$$

- $E_1$  narrow: slow convergence (**preconditioning, acceleration**)
- $E_1$  weakly singular:  $dS/d\tau(0)$  infinite (**grid refinement**)
- (High) gradients in  $S_0$  (**gr, linear interpolation instead parabolic**)
- Optically thick spectral lines ( $\tau^* \gg 1$ ,  $1-\omega \ll 1$ ) (**gr**)
- Iterative methods stopping criterion (**multi-grid?**)
- Discretization, numerical parameters (**gr**), roundoff errors
- Iterative methods are slow, e.g. multi-D (**Krylov, parallel?**)

# Known difficulties - Surface ( $\infty$ )

$$S(\tau) = S_0(\tau) + \varpi(\tau) \frac{1}{2} \int_0^{\tau^*} E_1(|t - \tau|) S(t) dt$$

- std problem ( $S_0 = \varepsilon$ ):  
 $S(0) = \sqrt{\varepsilon}$ ,  $S(\infty) = 1$
- $dS/d\tau(0)$  infinite  
→ refined grid near surface

Source function  $S$  for the standard problem (weak line)

Chevallier, Paletou & Rutily, A&A (2003)

# Known difficulties - Surface

- $1-\omega$ ,  $\tau^* =$   
0.5, 2 (continuum),  
1e-2, 20 (average line),  
1e-8, 2e8 (strong line).
- accuracy worst **NEAR**  
surface (grid 1e-4)
- needs refined grid near  
surface (log-spaced)

Accuracy of ALI for the standard problem  
**Chevallier, Paletou & Rutily, A&A (2003)**

# Known difficulties (**solutions**)

$$S(\tau) = S_0(\tau) + \varpi(\tau) \frac{1}{2} \int_0^{\tau^*} E_1(|t - \tau|) S(t) dt$$

- $E_1$  narrow: slow convergence (**preconditioning, acceleration**)
- $E_1$  weakly singular:  $dS/d\tau(0)$  infinite (**grid refinement**)
- (High) gradients in  $S_0$  (**gr, linear interpolation instead parabolic**)
- Optically thick spectral lines ( $\tau^* \gg 1$ ,  $1-\omega \ll 1$ ) (**gr**)
- Iterative methods stopping criterion (**multi-grid?**)
- Discretization, numerical parameters (**gr**), roundoff errors
- Iterative methods are slow, e.g. multi-D (**Krylov, parallel?**)

# Known difficulties - $S_0$ gradients

$S_0$  = constant:

4% surface,  $\ll 1$  inside

$S_0$  = gradient:

0.1% surface, 30% inside

+ roundoff error (small)

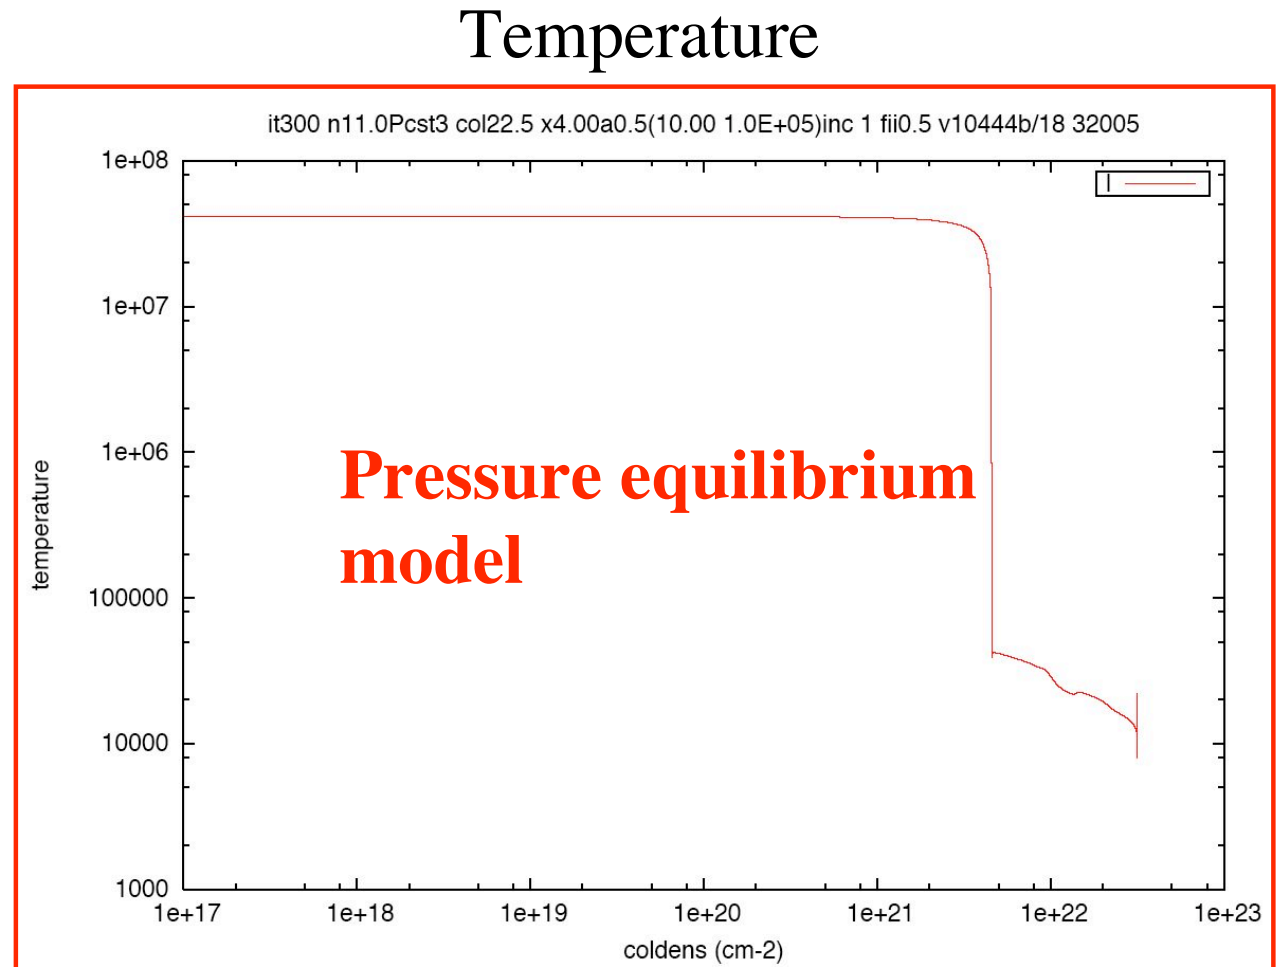

ALI accuracy, stellar atmospheres grid

$$S_0 = 1, \exp(-\tau)$$

# Known difficulties - High $S_0$ gradients (AGN, $P=\text{cte} \rightarrow$ thermal instability)

- ALI+Ng for transfer
- 600 layers  
(50-100/dec. vs. 7 atm.)  
Need time (iterations)
- High gradients  
OK : adaptive grid
- Number of angles  
OK : choice 3 (vs. 20)

# Known difficulties - High $S_0$ gradients (AGN, $P=\text{cte}$ $\rightarrow$ thermal instability)

- stopping criterium change  $< 0.1\%$   
and less than 100 iterations  
+ empirical convergence tricks

- default : parabolic

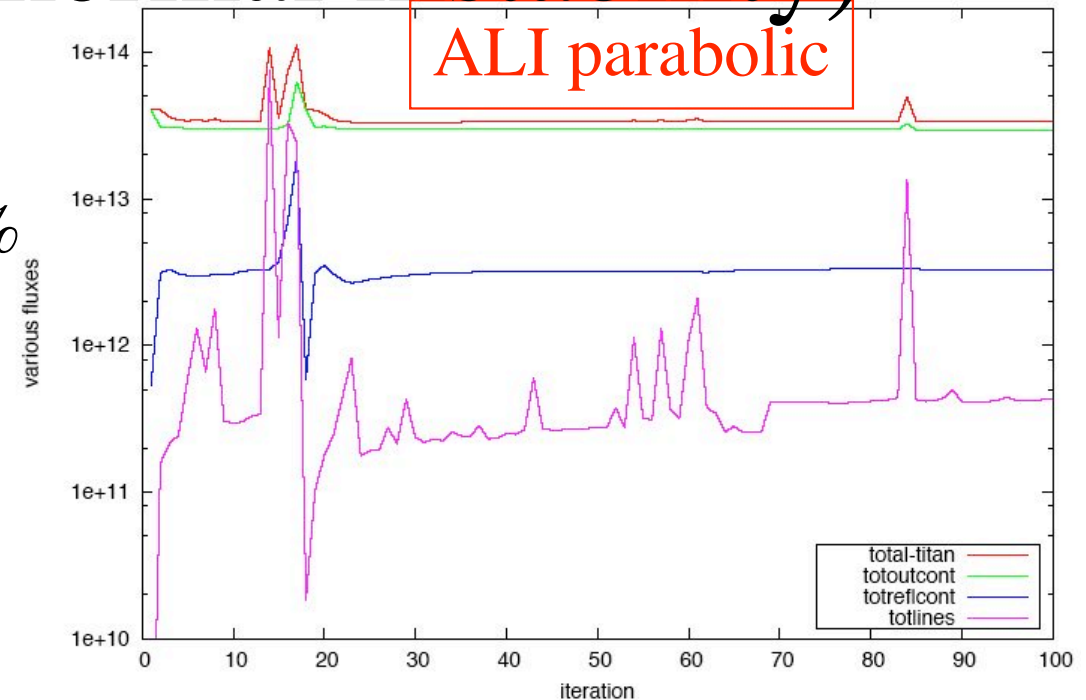

no convergence (some  $P$  cte WA)

Cause : interpolation instabilities

- 1 solution : linear interpolation

Convergence (not always)

Longer (iterations 300 vs.50)

# Known difficulties (**solutions**)

$$S(\tau) = S_0(\tau) + \varpi(\tau) \frac{1}{2} \int_0^{\tau^*} E_1(|t - \tau|) S(t) dt$$

- $E_1$  narrow: slow convergence (**preconditioning, acceleration**)
- $E_1$  weakly singular:  $dS/d\tau(0)$  infinite (**grid refinement**)
- (High) gradients in  $S_0$  (**gr, linear interpolation instead parabolic**)
- Optically thick spectral lines ( $\tau^* \gg 1$ ,  $1-\omega \ll 1$ ) (**gr**)
- Iterative methods stopping criterion (**multi-grid?**)
- Discretization, numerical parameters (**gr**), roundoff errors
- Iterative methods are slow, e.g. multi-D (**Krylov, parallel?**)

# Known difficulties - Discretization (standard problem)

- $1-\omega$ ,  $\tau^*$  =  
0.5, 2 (continuum),  
1e-2, 20 (average line),  
1e-8, 2e8 (strong line).
- Maximum error

Accuracy of ALI for the standard problem  
Chevallier, Paletou & Rutily, A&A (2003)

# Known difficulties - Discretization

## (standard problem)

- $1-\omega, \tau^* = 1e-8, 2e8$   
(strong line).

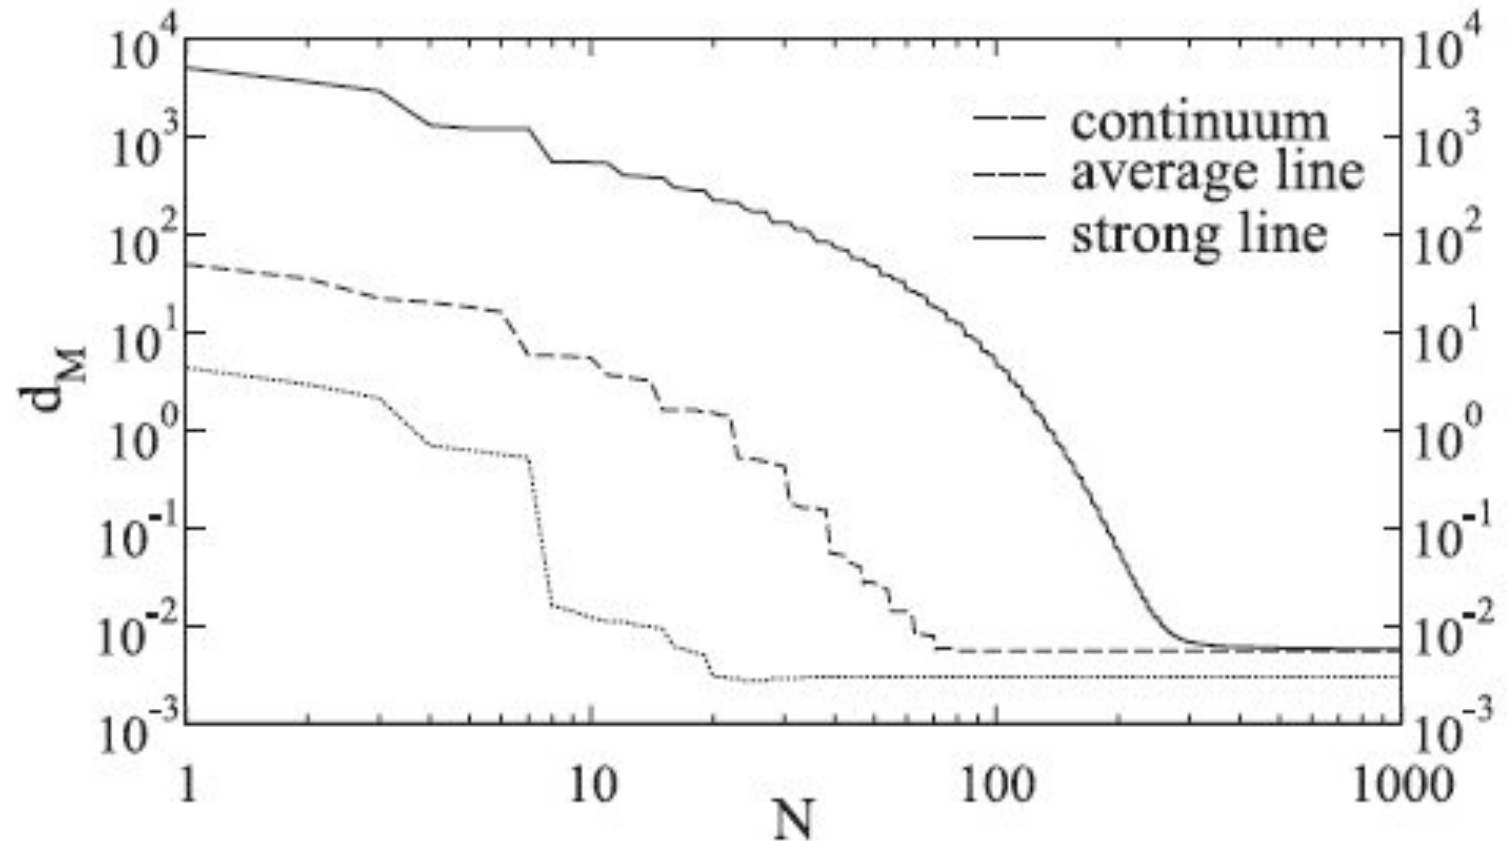

Accuracy of ALI for the standard problem strong line, x=spatial, y=angular  
**Chevallier, Paletou & Rutily, A&A (2003)**

# Known difficulties - Discretization

(standard problem)

- $1-\omega$ ,  $\tau^* =$   
0.5, 2 (continuum),  
1e-2, 20 (average line)  
1e-8, 2e8 (strong line)
- Maximum error

Accuracy of ALI for the standard problem  
along the iteration number

Chevallier, Paletou & Rutily, A&A (2003)

# Known difficulties - Discretization

(standard problem)

Optimal number of iterations of ALI for the standard problem  
**Chevallier, Paletou & Rutily, A&A (2003)**

# Known difficulties (**solutions**)

$$S(\tau) = S_0(\tau) + \varpi(\tau) \frac{1}{2} \int_0^{\tau^*} E_1(|t - \tau|) S(t) dt$$

- $E_1$  narrow: slow convergence (**preconditioning, acceleration**)
- $E_1$  weakly singular:  $dS/d\tau(0)$  infinite (**grid refinement**)
- (High) gradients in  $S_0$  (**gr, linear interpolation instead parabolic**)
- Optically thick spectral lines ( $\tau^* \gg 1$ ,  $1-\omega \ll 1$ ) (**gr**)
- Iterative methods stopping criterion (**multi-grid?**)
- Discretization, numerical parameters (**gr**), roundoff errors
- Iterative methods are slow, e.g. multi-D (**Krylov, parallel?**)

# Known difficulties - Stopping criterion

Accuracy of ALI+Ng for the standard problem with iterations (strong line)

Chevallier, Paletou, & Rutily, SF2A proceedings (2003)

# Known difficulties - Stopping criterion

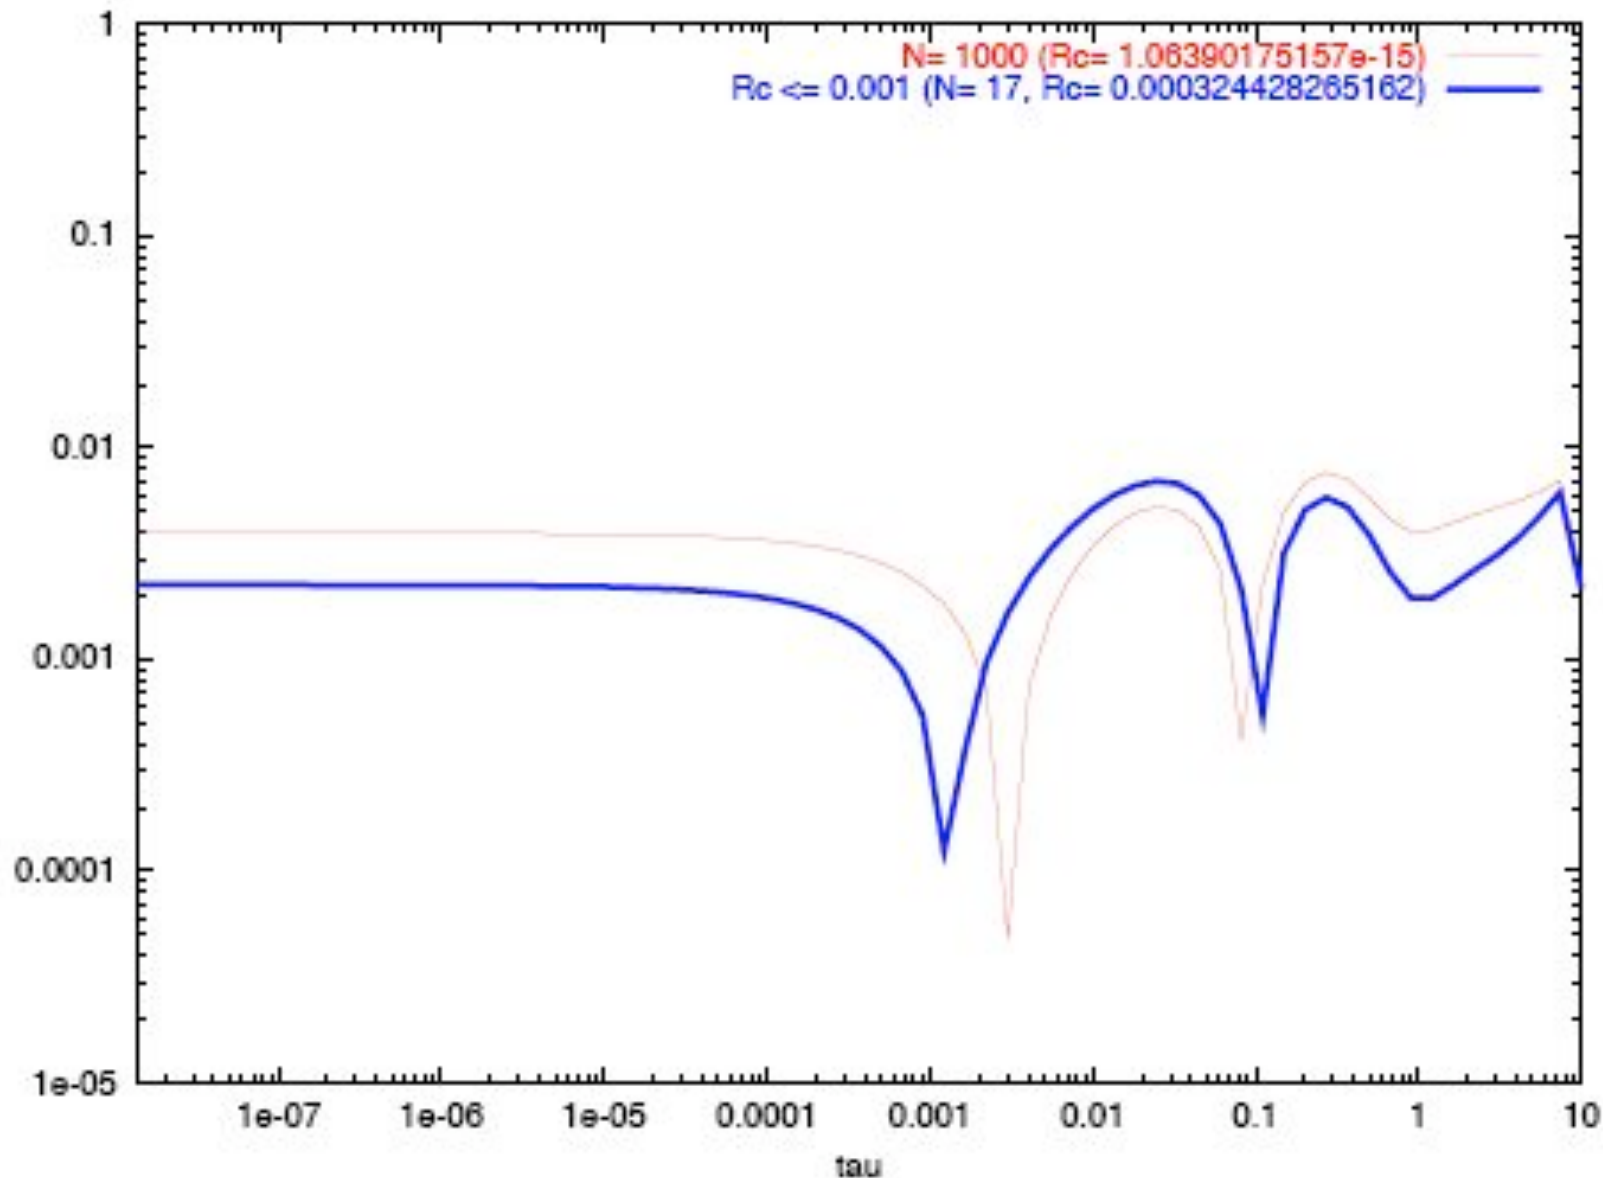

Accuracy of ALI+Ng for the standard problem with difficulty  
Chevallier, Paletou, & Rutily, SF2A proceedings (2003)

# Testing ALI std parameters

- TLUSTY stellar atmosphere code (I. Hubeny) standard parameters
- continuum transfer equation, but equivalent to line also (Milne)
- 4 functions  $S_0(\tau) = 1, \tau, \tau^5, \exp(-\tau), \exp(\tau)$
- constant albedo  $\omega$
- 3 physical conditions  $(\omega, \tau^*) =$ 
  - (0.01, 10): continuum,
  - ( $10^{-4}$ ,  $10^3$ ): average line,
  - ( $10^{-8}$ ,  $10^8$ ): strong line.
- logarithmic spatial grid, 70 points from  $10^{-9} \tau^*$  to  $\tau^*$
- Gauss-Legendre angular grid, 3 points per quadrant
- Stop iterations when  $R_c = 10^{-3}$ .

# Testing ALI std parameters - $B(\tau) = 1$ (continuum)

# Testing ALI std parameters - $B(\tau) = 1$ (average line)

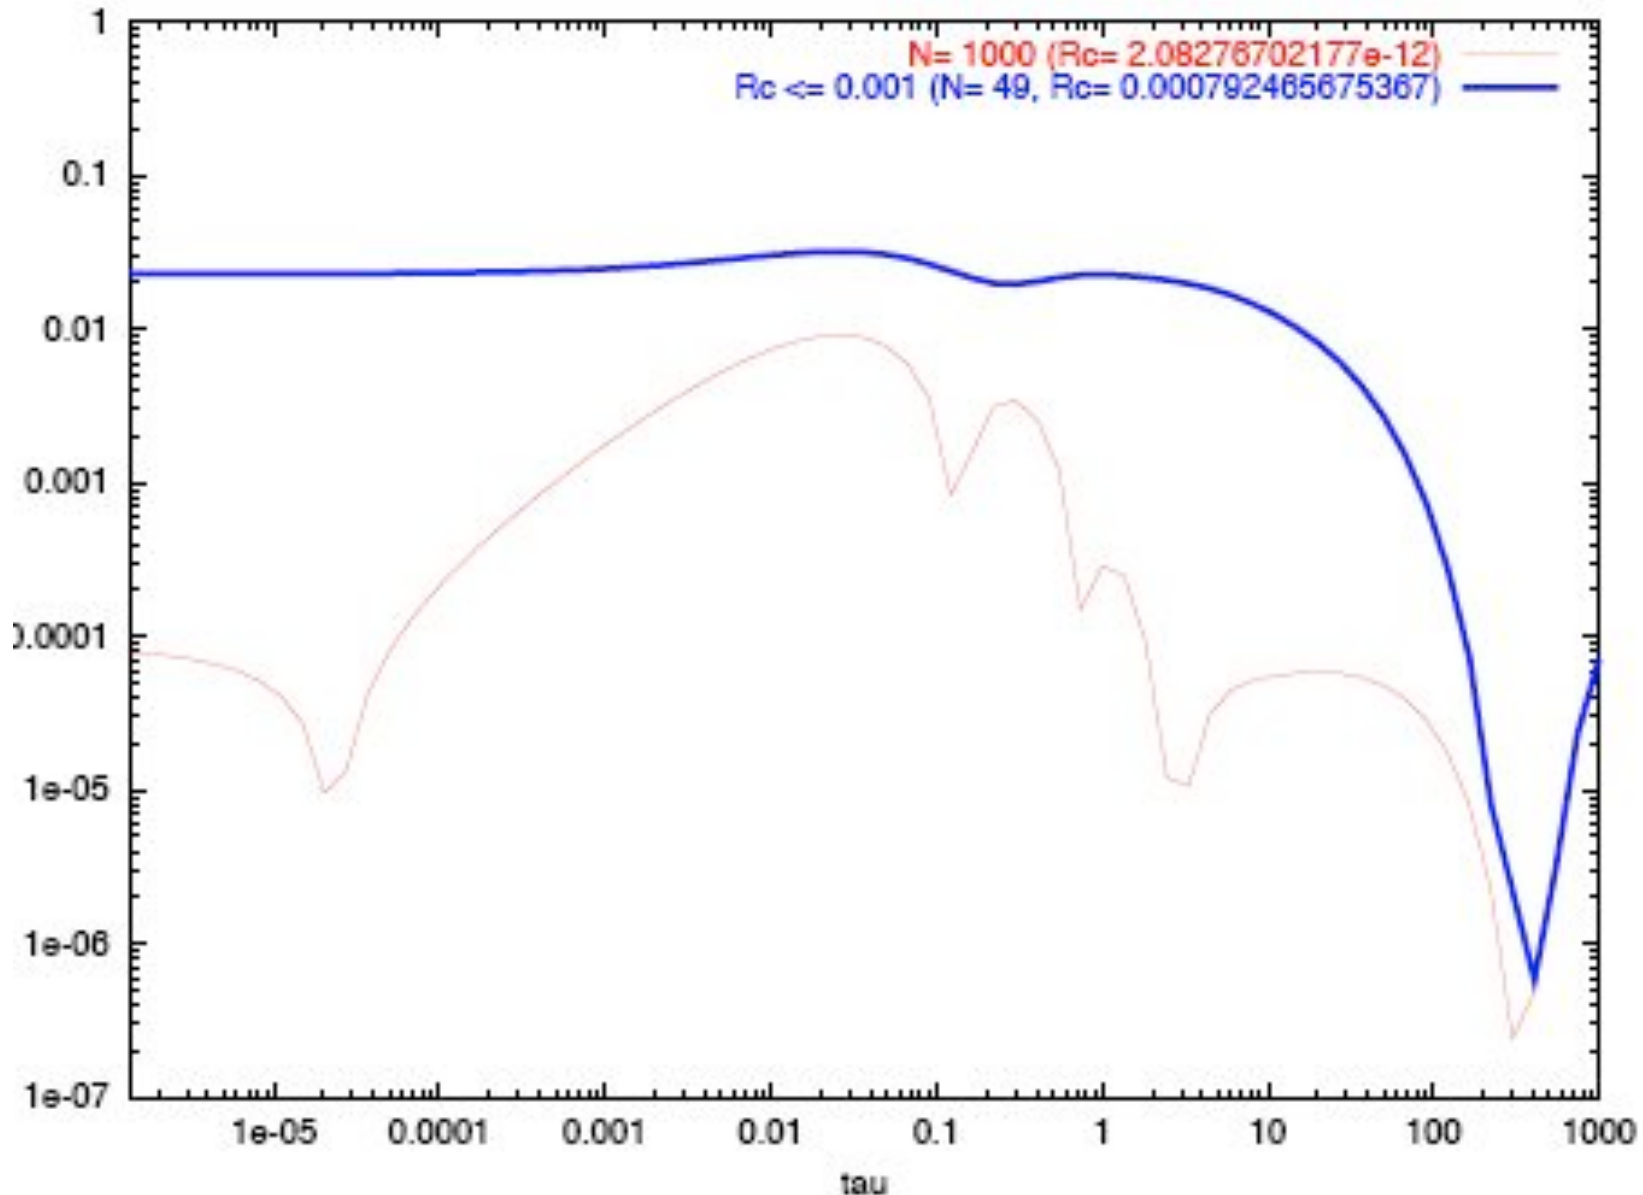

# Testing ALI std parameters - $B(\tau) = 1$ (strong line)

# Testing ALI std parameters - $B(\tau) = \tau$ (continuum)

# Testing ALI std parameters - $B(\tau) = \tau$ (average line)

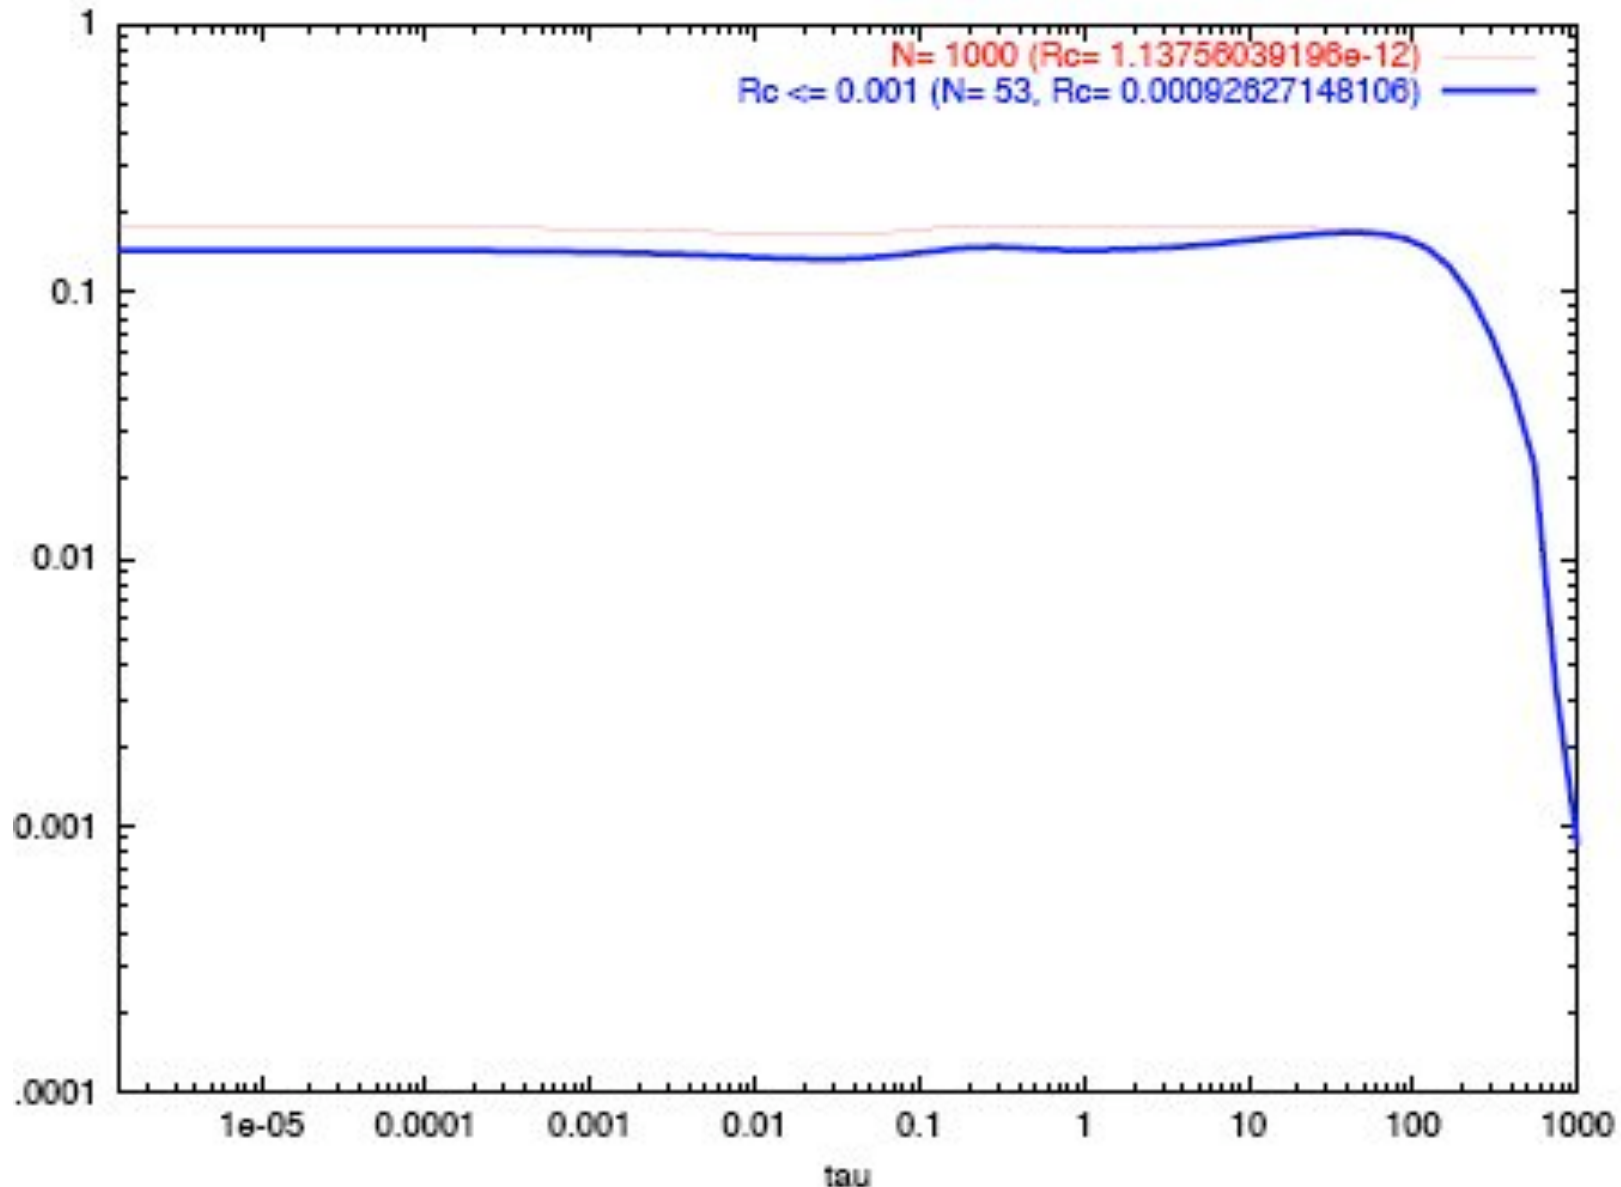

# Testing ALI std parameters - $B(\tau) = \tau$ (strong line)

# Testing ALI std parameters - $B(\tau) = \tau^5$ (continuum)

# Testing ALI std parameters - $B(\tau) = \tau^5$ (average line)

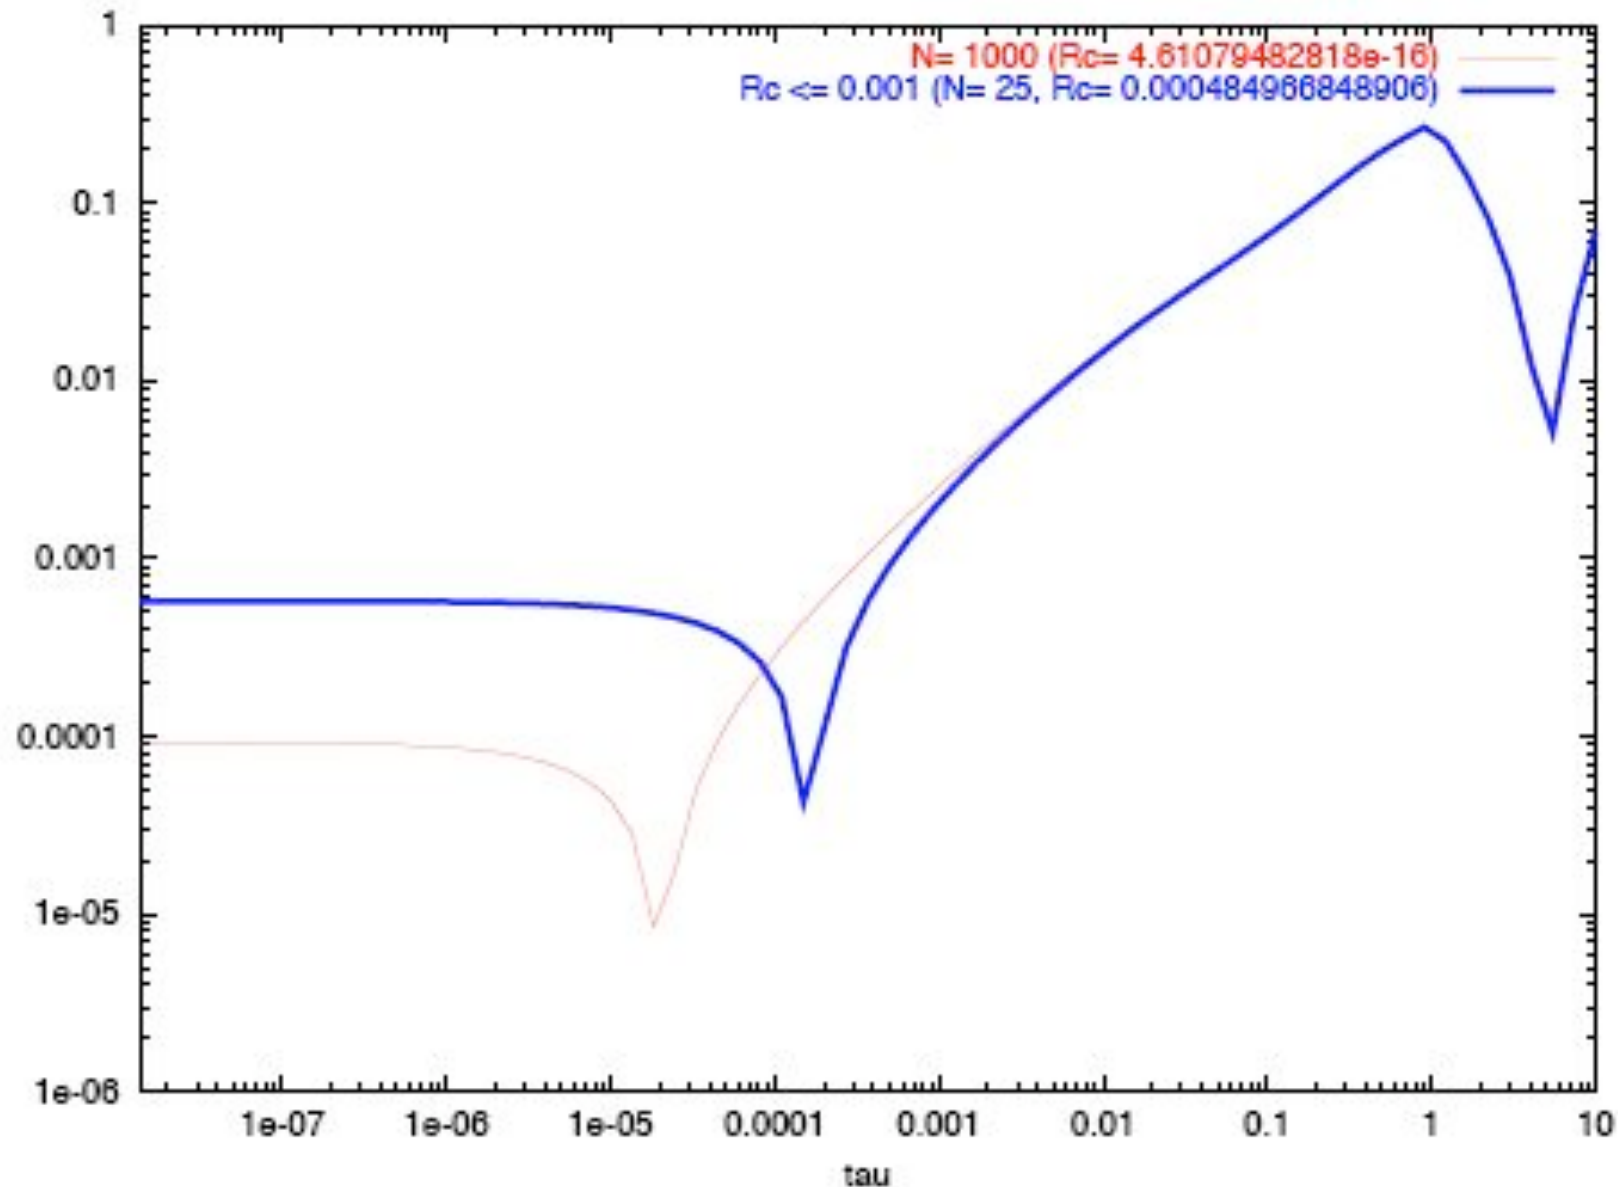

# Testing ALI std parameters - $B(\tau) = \tau^5$ (strong line)

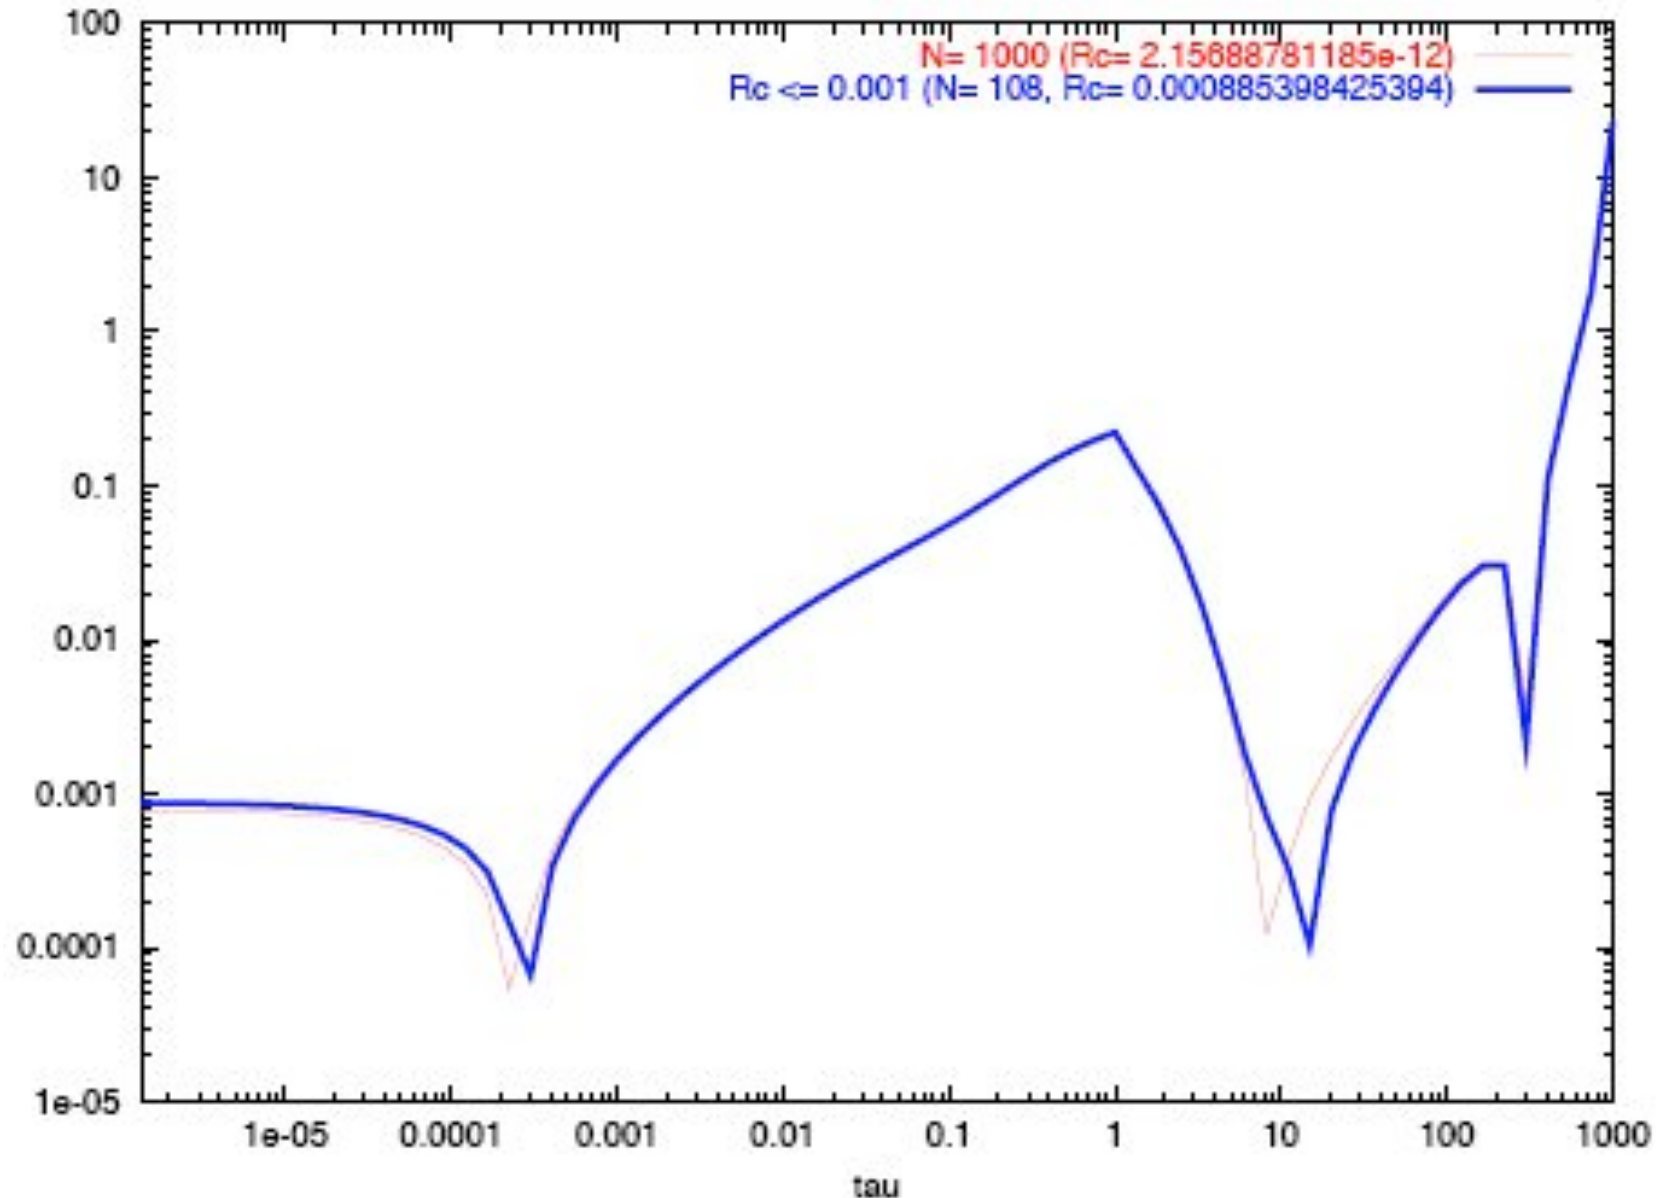

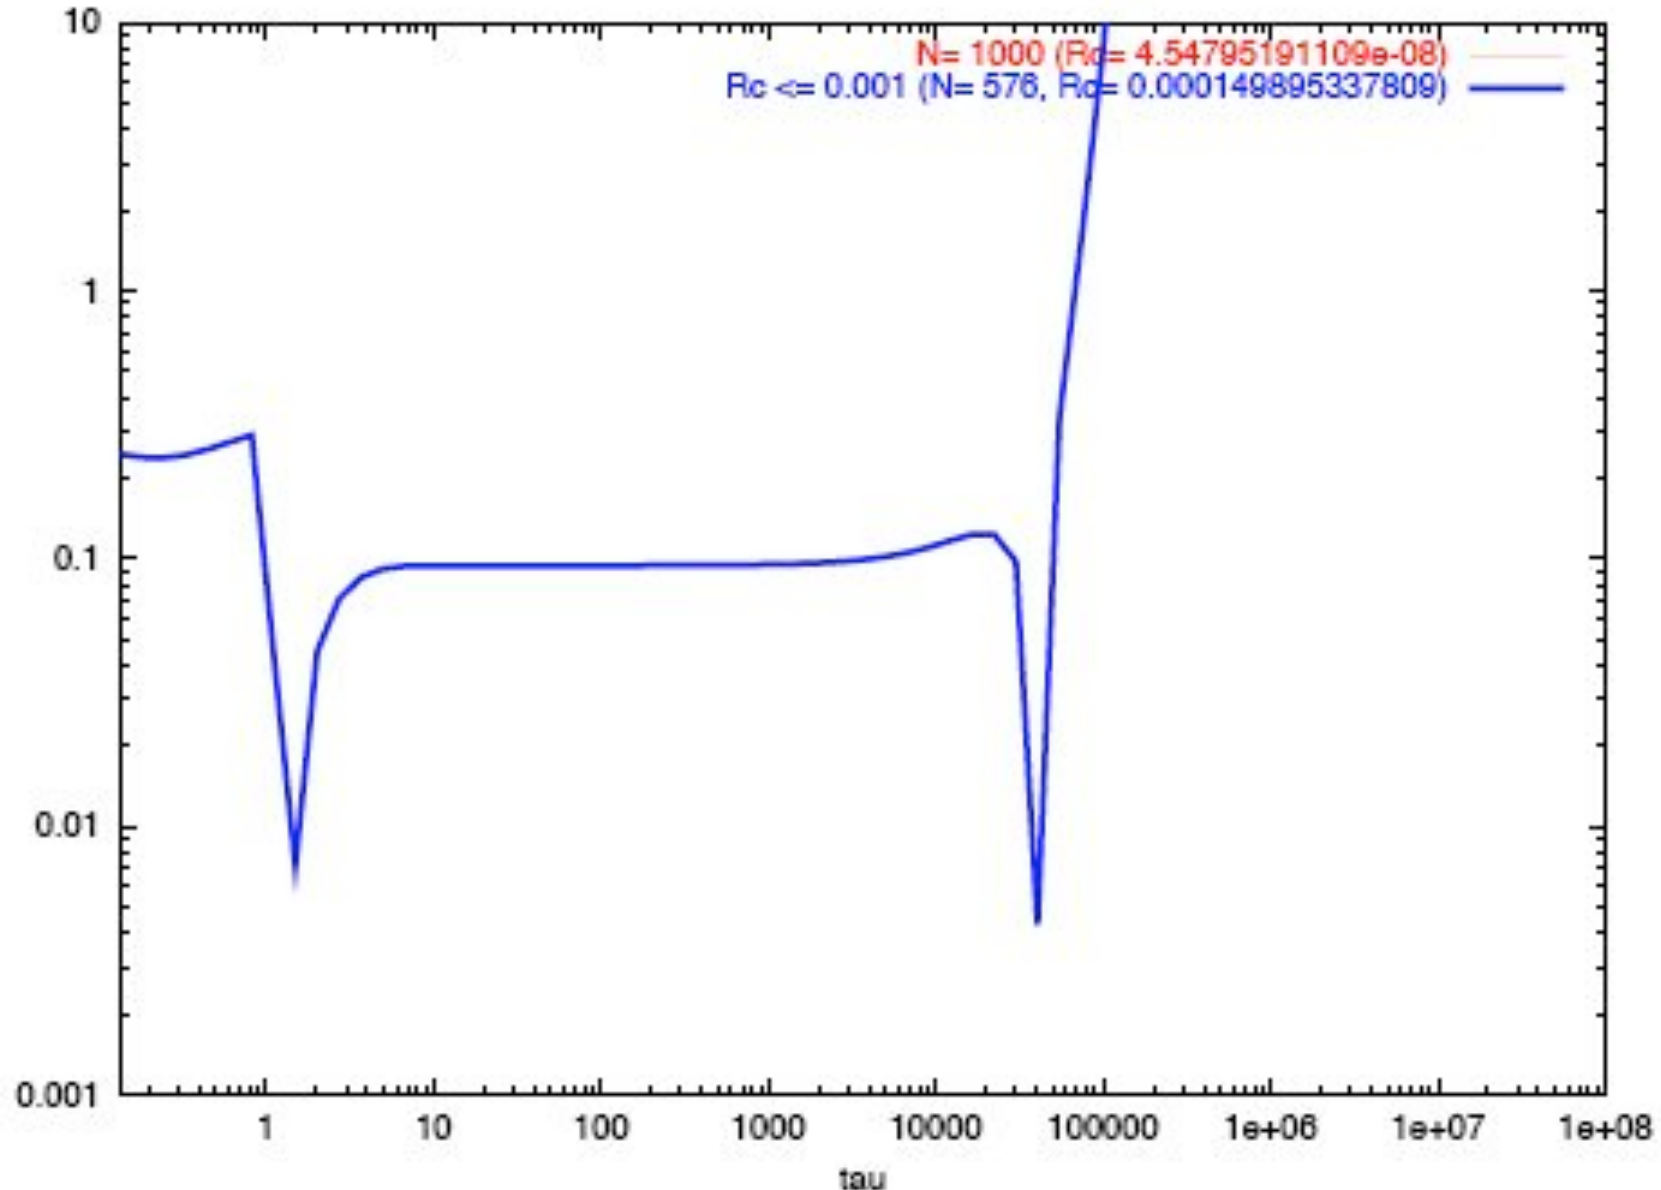

# Testing ALI std parameters - $B(\tau) = \exp(-\tau)$ (continuum)

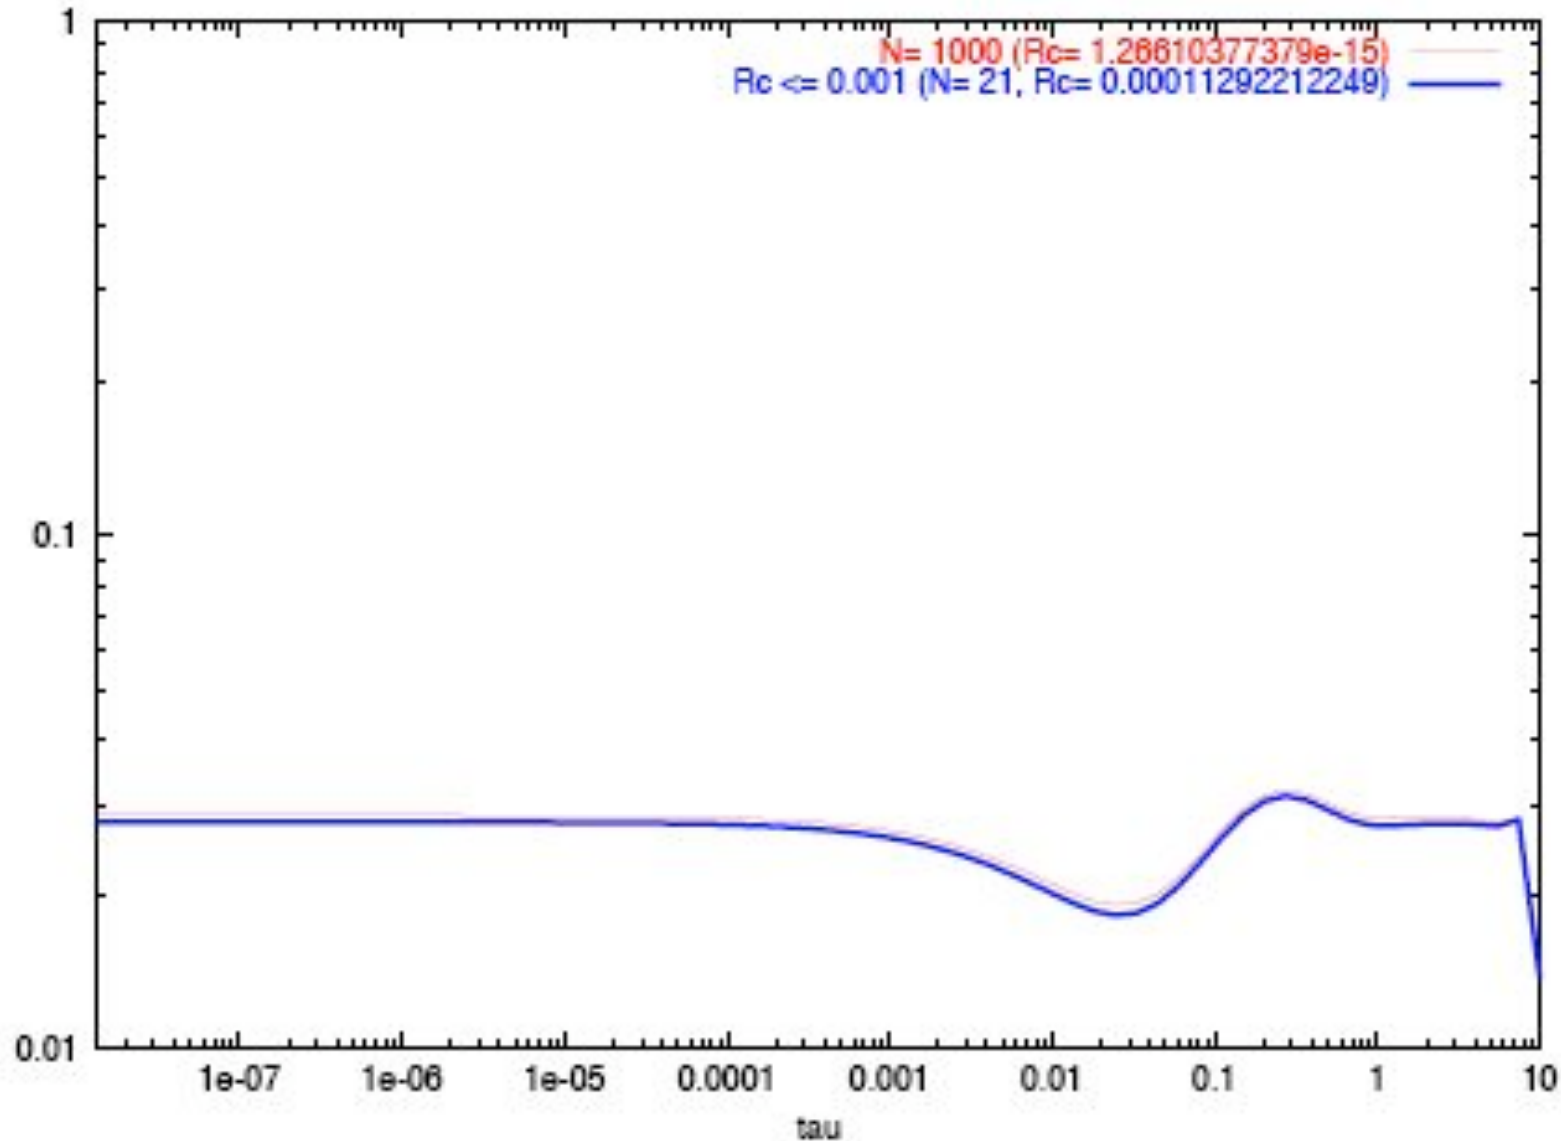

# Testing ALI std parameters - $B(\tau) = \exp(-\tau)$ (average line)

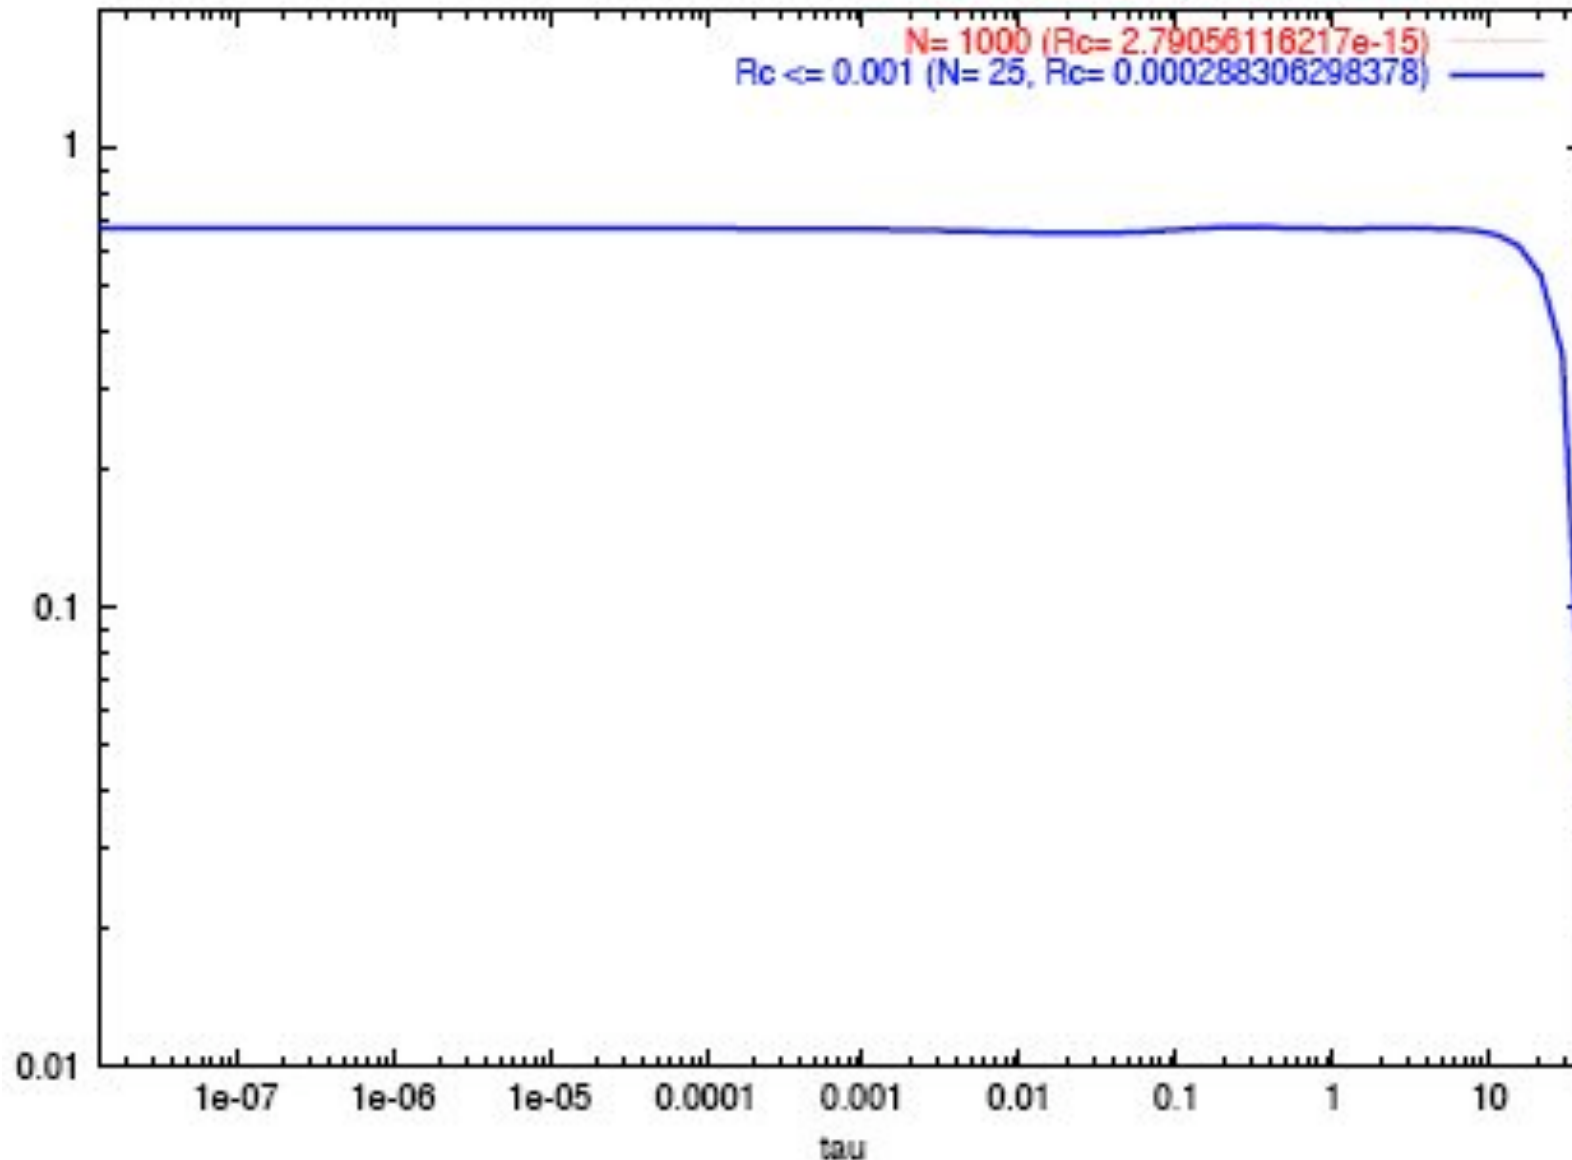

# Testing ALI std parameters - $B(\tau) = \exp(-\tau)$ (strong line)

# Testing ALI std parameters - $B(\tau) = \exp(\tau)$ (continuum)

# Testing ALI std parameters - $B(\tau) = \exp(\tau)$ (average line)

# Testing ALI std parameters - $B(\tau) = \exp(\tau)$ (strong line)

# Testing ALI std parameters - Summary

$$S_0(\tau) = (1 - \varpi)B(\tau) + \frac{\varpi}{2} B(\tau^*)E_2(\tau^* - \tau)$$

$B(\vartheta)$	$T = 0.99, \vartheta^* = 10$	$\varepsilon = 1 - T = 10^{-4}, \vartheta^* = 1000$	$\varepsilon = 1 - T = 10^{-8}, \vartheta^* = 10^8$
1	0.2% - 0.7%	4%	15%
$\vartheta$	0.5 - 0.9%	3%	20%
$\vartheta^5$	1.5 - 2%	15 - 20%	9 - 20%
$\exp(-\vartheta)$	Maximum error in the deep layers		
	30%	30%	30%
$\exp(+\vartheta)$	2%	$T = 0.99, \vartheta^* = 40$	$T = 0.99, \vartheta^* = 100$
		65%	3000%

Tests ALI for some exact problems using ARTY

Chevallier et al. A&A 411, 221(2004); Chevallier (GRETA 2004)

# Exact methods - ARTY

- B. Rutily (1992): exact solutions 1D (maths >16 yr, **2D, 3D possible**)  
12 publications TTSP, JQSRT
- Continuum and line (Milne)
- Method:
  - Finite Laplace transform,
  - complex domain,
  - integral formulation,
  - Fredholm equations regular kernel
- Code ARTY: numerical evaluation (6 yr, 300+ routines, 50 000 lines)
- **NO numerical parameters** (builtin)
- Applications: Atmospheres (star, planets), Benchmark, etc.

Accurate, reliable, fast

ARTY Standard relative error  
**Chevallier & Rutily, JQSRT (2005)**

# Formulation of a problem (ARTY)

## Geometry and dynamics ( $\mathbf{r}, t$ )

- Stationary ? YES NO
- Static ? YES NO
- Homogeneous ? YES NO
- Geometry
  - 1D
    - Plane-parallel
      - Infinite, semi-infinite, finite
    - Spherical
      - infinite, finite radius, non connexe
    - Cylindrical
      - infinite, finite radius, non connexe
  - 2D, 3D, any

## Type of diffusion ( $\mathbf{n}, \mathbf{v}$ )

- isotropical
  - conservative (albedo = 1)
  - non conservative
- anisotropical
- monochromatic
- With frequency redistribution
  - Complete redistribution
  - Partial redistribution

# Classical references solutions and tests in literature

## Classical reference solutions

- $S(0) = \sqrt{\epsilon} S^*(0)$ , exact for isothermal semi-infinite with no illumination (Bueno et al. 1995)
- Eddington approximation semi-infinite or finite (Bueno et al. 1995)

## Tests in literature (unsufficient, no exact reference solution)

- Comparison between 3 codes  $\epsilon=0.5$ : easy (Pascucci et al. 2004)
- Comparison photoionisation codes (Pequignot et al. 2001)
- Elitzur & Asensio Ramos (2005): Escape probability, ALI
- ...

# Classical reference solution - $\sqrt{\epsilon}$ -law

- ▶ point = couple  $(\epsilon, \tau^*)$
- ▶  $\epsilon \in [10^{-12}, 1]$  et  $\tau^* \in [0.1, 10^8]$
- ▶  $k(\epsilon) \approx \sqrt{3\epsilon}$  pour  $\epsilon \rightarrow 0$   
(inverse profondeur thermalisation)
- ▶ erreur  $< 10^{-4}$  pour  $k(\epsilon)\tau^* > 10$
- ▶ non valable continuum  
( $k(\epsilon)\tau^* \approx 3.3$ )

# Classical reference solution - Eddington

II

- ▶ slab isotherme non éclairé
- ▶ problème  
intégral-différentiel →  
différentiel
- ▶ erreur ALI/Eddington :  
 $3.5 \times 10^{-3}$
- ▶ erreur Eddington :  
 $8.6 \times 10^{-2}$
- ▶ approximation valable  
surface et région  
optiquement épaisse

$$S_E(\epsilon, \tau^*, \tau) = 1 - (1 - \epsilon) \times \frac{\exp(-\sqrt{3\epsilon} \tau) + \exp(-\sqrt{3\epsilon} (\tau^* - \tau))}{1 + \sqrt{\epsilon} + (1 - \sqrt{\epsilon}) \exp(-\sqrt{3\epsilon} \tau^*)}$$

# ALI method (+ GS/SOR)

- 2-stream = ALI 1 angle
- ALI gives  $I(z, \mu, \nu)$  : 1%
- Fast robust iterative method
- **Max. accuracy :  $z, \mu$ -grid**
- PRD, polarization, multi-D...
- Numerical parameters:  
 $\tau$ ,  $\mu$ -grid,  $N$  ( $R_c$ ), CI,  
interp.  $S(\tau)$ : quadratic/linear  
 $\Rightarrow$  Needs fine tuning
- **GS/SOR > x5 faster**

Quang, Paletou, Chevallier (2004)  
Chevallier et al., A&A (2003)

# Known difficulties (**solutions**)

$$S(\tau) = S_0(\tau) + \varpi(\tau) \frac{1}{2} \int_0^{\tau^*} E_1(|t - \tau|) S(t) dt$$

- $E_1$  narrow: slow convergence (**preconditioning, acceleration**)
- $E_1$  weakly singular:  $dS/d\tau(0)$  infinite (**grid refinement**)
- (High) gradients in  $S_0$  (**gr, linear interpolation instead parabolic**)
- Optically thick spectral lines ( $\tau^* \gg 1$ ,  $1-\omega \ll 1$ ) (**gr**)
- Iterative methods stopping criterion (**multi-grid?**)
- Discretization, numerical parameters (**gr**), roundoff errors
- Iterative methods are slow, e.g. multi-D (**Krylov, parallel?**)

# Current status of methods (T. Lanz)

- Realistic problems: dead end, a few days to months without radiative transfer (i.e., cosmology, 3D, 7 variables)
- Idealised star ( $10^7$  points)- cosmological simulation ( $10^{24}$  points):  
space ( $10^4$ - $10^9$ ), time ( $1$ - $10^4$ ), directions ( $10$ - $10^4$ ), frequencies ( $10$ - $10^7$ )

## Methods (strength, weakness)

- numerical: accurate (a few %) (less than expected), slow
  - ALI: 3ms per point per CPU (1 day -  $10^{14}$  yr),
  - Monte-Carlo: difficulties with spectral lines (time  $\times 10^8$  ?)
- approximate: fast, not accurate (for whole physical parameter space)
- Exact: fast and accurate, particular problems

# TEST ALI/GS/SOR 2D

## ARTY - ponctual source

**Fig. 5.** Relative errors between spatial averages of the angular moments  $J$ ,  $H$  and  $K$  given by the 2D-SOR 2-level iterative process and their analytical values for  $\epsilon = 0.01$  vs. the number of spatial points of a square 2D grid of extension  $\tau^* = 100$  in each direction.

# TEST ALI/GS/SOR 2D

## ARTY - ponctual source

tion time (for a Pentium-4 @ 3 GHz processor) and number of iterations for the H I multilevel benchmark mode  $y_{max} = 5\,000$  km and  $z_{max} = 30\,000$  km together with 3 angles per octant and 8 frequencies; the temperature of the gas as pressure  $p_g = 1 \text{ dyn cm}^{-2}$ .

Points number	MALI 2D	GSM 2D	SOR 2D	MG 2D	$R_c$
123x123	3min9s (46)	2min19s (29)	1min17s (16)	55s (11)	$1.1 \times 10^{-2}$
163x163	9min39s (79)	6min56s (48)	3min33s (24)	1min52s (13)	$2.1 \times 10^{-3}$
203x203	22min47s (116)	14min36s (68)	7min34s (33)	2min50s (14)	$5.7 \times 10^{-4}$
243x243	45min32s (158)	29min10s (90)	14min3s (43)	4min13s (14)	$1.9 \times 10^{-4}$

# Conclusion

- Solving the transfer equation is difficult but not hopeless
- Iterative methods do converge (slowly), we know some solutions for 1D
- Developing new methods, or making codes need real reference solutions (ARTY, benchmarks can be done)
- Tests available: surprises with classical numerical methods (ALI)
- Next tests: moments methods, escape probability,...
- Current work in France:
  - GRETA group (Ph. Stee) for surveys, improvements, discussion
  - ALI/GS/SOR in 1D and 2D (F. Paletou, OMP, Toulouse), CG in progress
  - Same in 3D (F. Thévenin, GAIA)
  - New 1D algorithms (CG based) with mathematicians (St Etienne, France; Moscow)
- Radiative transfer developments (independent of a given problem) should be a research thema for astrophysicists
